

TA 154

A 500 ohm/volt meter was used for taking the voltage readings; the receiver was switched to the "M" band and operating under "no signal" conditions. In those cases where the resistance of a coil is omitted, the value is less than one ohm.

In the diagram, the blank positions and spare, or anchoring, tags on the switches are shown by a spot. The switches S1(a) to S1(h) are shown in the 11 metre position and the sliders rotate anti-clockwise as shown by the arrows. All the switch wafers are drawn as seen from the rear of the chassis, and are numbered from the front. The black contacts and inner rotors are on the hidden sides of the wafers. The "Tone" switch is shown in the "R1" position.
